# Sustainability and E-waste

It's no lie that electronic waste can be extremely problematic for the environment. Harsh chemicals such as lead, mercury and arsenic can pollute our soil and water supplies causing some serious issues for ecosystems and health around the world. Here at Truis, the environmentally friendly route for disposing of not only general waste but also e-waste is a major contribution to our sustainability strategy. We pass our recycling and technology decommissioning skills onto our customers with a wide range of services including disk shredding, hardware storage, e-wasting any unneeded hardware and even rehoming old hardware for new projects.

## Our process:

### Shipping and Logistics

Old devices can often sit in a cupboard or in a box in a room for an extended period. We understand getting rid of these devices can be an issue of logistics and time spent. Let us take the brunt of getting these devices out of your hands, we can organise packing and shipment back to our warehouse to process any devices that require decommissioning.

### Storage and warehousing

Is space an issue for you in your office or building? Truis has warehousing facilities suited to store and begin processing your aging hardware. Our state-of-the-art facility can house any type of hardware from large storage units to racks and servers.

### Asset tracking and documentation

After we receive your hardware we audit and record all the assets into a detailed report for you. This helps you keep track of your assets so that you can advise as on what you want to dispose of or keep.

### Secure wipe or device destruction

If the devices have seen their day, we can destroy any hard drives and e-waste them while also decommissioning the rest of the hardware for recycling. To comply with security policies and procedures we offer a certificate of destruction and video recording of any disks destroyed.
